Mobile industrial light tower

AUST Light Tower has released a mobile outdoor lighting solution for commercial, industrial, promotional and outdoor applications.

Comprising an inflatable, adjustable, semi-transparent tube and inflator, the Light Tower stands up to 5 m high and is capable of illuminating an area of 10,000 m² in less than three minutes.

It weighs 25 kg and can be operated by one person.

The adjustable tube inflates within one minute using a built-in fan, and after five minutes the sodium lamp in the top of the tower has a capacity of up to 600 watts.

The Light Tower is made of a special semi-transparent material that helps to defuse the light, giving a softer glow so users have better visibility.

Shadows that normally occur with flood lights are reduced, as the tower is lit from above.

The tower is stable and can withstand wind gusts of 70 km per hour with the assistance of

tension ropes around the unit's base. It can also operate under harsh conditions; from sub zero temperatures to the heat of a desert.

The tower can be powered by a four stroke generator.

The product has been used

successfully overseas, particularly in search and rescues, disaster response, road construction and by the Russian Space Program to recover space modules on their return to Earth.

The tower is currently being used by airports, SES branches, government defence departments and local councils in Australia.

The tower is available in a low-frame and high-frame model, with the high-frame model made to fit a generator.
